

ROUND HEAD SCREW FOR PLATES

SCREW FOR PERFORATED PLATES

Cylindrical shoulder designed for fastening perforated metal plates with 5,0 mm | 0.20 inches and 7,0 mm | 0.28 inches holes. Achieves an interlocking effect with the hole in the plate, thus guaranteeing excellent static performance.

SUPERIOR STRENGTH

Steel with superb bending yield strength (minimum of $F_{yb} = 1240 \text{ N/mm}^2$ | 180,000 psi according to ESR-4645). Very high torsional strength $f_{tor,k}$ for safer screwing.

STRUCTURAL APPLICATIONS

Evaluated by ICC-ES according to Acceptance Criteria AC 233. Withdrawal values for any angle between the screw axis and the grain (including end-grain).

CHARACTERISTICS

FOCUS	screw for perforated plates	
HEAD	round with cylindrical underhead	
DIAMETER	5,0 7,0 mm	0.20 0.28 inches
LENGTH	from 25 to 100 mm	1 to 4 inches

MATERIAL

Bright zinc plated carbon steel.

FIELDS OF USE

- sawn lumber and timber
 - Glued Laminated Timber
 - CLT and other mass timber products
 - high density woods
- Dry in-service conditions.

■ GEOMETRY AND MECHANICAL CHARACTERISTICS

Nominal diameter	d_1	[in] ⁽¹⁾	0.20	0.28
Outer thread diameter	d_1	[mm]	5	7
		[in]	0.197	0.276
Head diameter	d_k	[in]	0.307	0.433
Root diameter	d_2	[in]	0.118	0.173
Underhead diameter	d_{UK}	[in]	0.193	0.276
Head thickness	t_1	[in]	0.094	0.138
Tip length	L_t	[in]	0.197	0.276
Pre-drilling hole diameter ⁽²⁾	d_v	[in]	0.12	0.16
Bending yield strength ⁽³⁾	$F_{y,b}$	[psi]	180,000	192,000
Tensile strength	f_{tens}	[lbf]	740	1600

⁽¹⁾ The nominal diameter of the screw is converted into imperial units and rounded up to the nearest decimal point.

⁽²⁾ Pre-drilling applies to softwood timber.

⁽³⁾ Bending yield strengths are determined in accordance with ASTM F1575 using the root diameter d_2 .

NOTES:

Tabulated reference lateral design values are applicable to screws installed perpendicular to the faces of the wood members and loaded as follows:

(1) $Z_{||}$ main member loaded parallel to the grain.

(2) $Z_{\perp}$ main member loaded perpendicular to the grain.

(3) The screw penetration in the main member is lower than 6 times the outer thread diameter as specified in ESR-4645.

Refer to page 7 for the general calculation principles.

NOTES:

- ⁽¹⁾ The embedded thread length does not comply with the minimum requirement of ESR-4645 (6 times the outer thread diameter for screws installed at 90° to the grain and 8 times the outer thread diameter for screws installed at an angle $0^\circ \leq \alpha < 90^\circ$ to the grain).
- ⁽²⁾ The embedded thread length does not comply with the minimum requirement of ESR-4645 (8 times the outer thread diameter for screws installed at an angle $0^\circ \leq \alpha < 90^\circ$ to the grain).

- ⁽³⁾ At least four screws must be used in a connection with screws installed in the wood member with an angle between the grain direction and screw axis $\alpha \leq 15^\circ$.

Refer to page 7 for the general calculation principles.

d = nominal screw diameter

stressed end
 $-90^\circ < \alpha < 90^\circ$

unloaded end
 $90^\circ < \alpha < 270^\circ$

stressed edge
 $0^\circ < \alpha < 180^\circ$

unload edge
 $180^\circ < \alpha < 360^\circ$

NOTES:

- The minimum spacing and distances comply with Table 9 of ESR-4645, where d refers to the nominal diameter of the screw.
- Values for spacing between staggered rows $a_{2,s}$ apply where fasteners in adjacent rows are offset by half of the spacing between fasteners in a row ($0.5 \cdot a_1$).
- Wood member stresses must be checked in accordance with Section 11.1.2 and Appendix E of the NDS, and end distances, edge distances and fastener spacing may need to be increased accordingly.

d = nominal screw diameter

NOTES:

- The tabulated values for the minimum spacing and distances are according to the European Technical Assessment ETA-11/0030. The values from ETA-11/0030 are based on extensive research studies carried out in Europe and are according to the well-established provisions from EN 1995:2014 (Eurocode 5). Designers may adopt, under their responsibility, the minimum spacing and distances from ETA-11/0030.
- Specific gravity of $G = 0.47$ is equivalent to a characteristic density of $\rho_k = 420 \text{ kg/m}^3$.
- In the case of timber-to-timber joints, the minimum spacing (a_1 , a_2) should be multiplied by a coefficient of 1.5.

GENERAL PRINCIPLES:

- Tabulated values must be multiplied by all adjustment factors included in the NDS for dowel-type fasteners to determine allowable loads for use with ASD, design loads for use with LRFD or both.
- As part of the connection design, the structural wood members must be checked for load-carrying capacity in accordance with Section 11.1.2 of the NDS and local stresses within multiple-fastener connections must be checked against Appendix E of the NDS to ensure the capacity of the connection and fastener group.
- Connections with multiple screws must be designed in accordance with Sections 11.2.2 and 12.6 of the NDS and the requirements in Section 4.1.7.3.1 of ESR-4645.
- LBS screws must be installed and used in dry in-service conditions in accordance with the NDS (wet service factor for connection CM is 1.0).
- Sizing and verification of the timber elements and steel plates must be done separately by the designer.

REFERENCE LATERAL DESIGN VALUES:

- Tabulated values are determined from the yield model equations in Section 12.3 and Table 12.3.1A of the NDS.
- The screw penetration into the main member is minimum 6 times the outer thread diameter unless otherwise noted.
- The reference lateral design values may be determined for other connection configurations in accordance with the NDS and Section 4.1.6.2 of ESR-4645.

STEEL-TO-WOOD

- The steel side member must have a minimum tensile strength equal to 58 ksi (400 MPa) and comply with the minimum requirements of ASTM A36.
- The wood main member thickness must be greater than the screw length less the thickness of the steel side member.

REFERENCE WITHDRAWAL DESIGN VALUES:

The reference withdrawal design values (W_{ref}) expressed in pounds-force per inch of thread penetration into the main member for screws installed at an angle of 90° to the grain can be found in Table 7 of ESR-4645 and are reported below.

d_1 [mm] [in]	Reference withdrawal design values W_{ref}			
	G=0.35	G=0.42	G=0.49	G=0.55
5 0.20	99	114	128	140
7 0.28	115	132	149	162

- The values for screws installed at an angle α to the grain are determined by multiplying the reference withdrawal design values with the effective thread penetration L_{eff} of the screw in the wood member and with the factor k_α :

$$W_\alpha = W_{ref} \cdot k_\alpha \cdot L_{eff}$$

Where:

- W_{ref} is the reference withdrawal design value for screws installed at an angle of 90° to the grain, as shown in the table on the left;
- k_α factor is calculated as:

$$k_\alpha = \begin{cases} 35^\circ < \alpha \leq 90^\circ & \frac{1}{1.2 \cdot \cos^2(\alpha) + \sin^2(\alpha)} \\ 0^\circ \leq \alpha \leq 35^\circ & 0.3 + 0.7 \frac{\alpha}{45} \end{cases}$$

- α is the angle between the grain direction and screw axis.

Tabulated values at page 4 are valid for L_{eff} equal to the screw thread length b minus the tip length L_t and $k_\alpha = 1$ for $\alpha = 90^\circ$, $k_\alpha = 0.91$ for $\alpha = 45^\circ$, $k_\alpha = 0.3$ for $\alpha = 0^\circ$.

- The minimum embedded thread length for screws installed at an angle $0^\circ \leq \alpha < 90^\circ$ to the grain is 8 times the outer thread diameter according to ESR-4645, unless otherwise noted.
- At least four screws must be used in a connection with screws installed in the wood member with an angle between screw axis and grain direction $\alpha \leq 15^\circ$.
- The reference withdrawal design values must be less than f_{tens} of the screw.
