

ANGLE BRACKET FOR SHEAR FORCES

LOW HOLES

Ideal for TIMBER FRAME, designed for fastening on platform beams or on the stringers of the frame structures. It also has certified values for use with partial nailing.

FRAME

Thanks to the lowered position of the holes on the vertical flange, it offers excellent shear strength values even on low height platform beams. $R_{2,k}$ up to 42.5 kN on both timber and concrete.

CONCRETE HOLES

The TITAN angle bracket are designed to offer two fastening possibilities, in order to avoid interference with the rods in the concrete support.

CHARACTERISTICS

FOCUS	shear joints
HEIGHT	71 mm
THICKNESS	3,0 mm
FASTENERS	LBA, LBS, VIN-FIX PRO, EPO-FIX PLUS, SKR, AB1

MATERIAL

Bright zinc plated carbon steel, three dimensional perforated plate.

FIELDS OF USE

Timber-to-concrete and timber-to-timber shear joints for panels and timber stringers.

- CLT, LVL
- solid timber and glulam
- framed structures (platform frame)
- timber based panels

TIMBER-TO-TIMBER

Ideal for shear joints between floor and wall and between wall and wall. The high shear strength allows to optimize the number of fastenings.

TITAN SILENT

Ideal in combination with XYLOFON PLATE to limit acoustic bridges and reduce walking vibrations of timber floors.

(*) To be cut on site

MATERIAL AND DURABILITY

TITAN F: carbon steel DX51D+Z275.

To be used in service classes 1 and 2 (EN 1995-1-1).

XYLOFON PLATE: 35-shore polyurethane compound.

ALADIN STRIPE: Compact EPDM.

FIELD OF USE

- Timber-to-concrete joints
- Timber-to-timber joints
- Timber-to-steel joints

GEOMETRY

INSTALLATION ON CONCRETE

To fix the **TITAN TCF200** angle bracket to the concrete, **2 anchors** must be used, according to one of the following installation modes:

IDEAL INSTALLATION

2 anchors positioned in the INTERNAL HOLES (IN)
(identified by a mark on the product)

Reduced stress on the anchor
(minimum e_y and k_t eccentricity)

Optimized connection strength

ALTERNATIVE INSTALLATION

2 anchors placed in the EXTERNAL HOLES (OUT)
(e.g. interaction between the anchor and the concrete support reinforcement)

Maximum stress on the anchor
(maximum e_y and k_t eccentricity)

Reduced connection strength

TCF200 - TTF200 | PARTIAL FASTENING PATTERNS FOR STRESS $F_{2/3}$

In the presence of design requirements such as $F_{2/3}$ stresses of different value or presence of sill or platform beam, it is possible to use partial fastening patterns, depending on the height H_B of the timber element:

configuration on timber	H_B	n_v pcs	fastening diagrams
full pattern	$H_B \geq 90\text{ mm}$	30	
pattern 3	$H_B \geq 80\text{ mm}$	25	
pattern 2	$H_B \geq 70\text{ mm}$	15	
pattern 1	$H_B \geq 60\text{ mm}$	10

NOTES:

⁽¹⁾ Installation of the anchors in the two internal holes (IN).

⁽²⁾ Installation of the anchors in the two external holes (OUT).

TCF200 | VERIFICATION OF CONCRETE ANCHORS FOR STRESS $F_{2/3}$

Fastening elements to the concrete through anchors shall be verified according to the load acting on the anchor, which can be evaluated through the geometric parameters on the table (e).

E_y calculation eccentricities vary depending on the type of installation selected: 2 internal anchors (IN) or 2 external anchors (OUT).

The anchor group must be verified for:

$$V_{Sd,x} = F_{2/3,d}$$

$$M_{Sd,z} = F_{2/3,d} \times e_{y,IN/OUT}$$

	LBS screws	Ø5,0 x 50				17,9

NOTES:

⁽¹⁾ The TTF200 angle bracket can be installed in combination with different resilient acoustic profiles inserted below the horizontal flange in full pattern configuration. The strength values in the table are given in ETA 11/0496 and calculated according to "Blaß, H.J. und Laskewitz, B. (2000); Load-Carrying Capacity of Joints with Dowel-Type fasteners and Interlayers.", conservatively disregarding the stiffness of the profile.

⁽²⁾ Profile thickness: in the case of ALADIN profile, the calculation took into account the reduced thickness of the profile itself, due to the corrugated section and the consequent crushing induced by the nail head during insertion.

- K_{ser} according to EN 1995-1-1 for timber-to-timber joint nails* GL24h/C24

Nails (without pre-drilling hole) $\frac{\rho_m^{1,5} \cdot d^{0,8}}{30}$ (EN 1995 § 7.1)

type	fastening type $\varnothing \times L$ [mm]	n_v [pcs]	K_{ser} [N/mm]
TCF200	LBA nails $\varnothing 4,0 \times 60$	30	26093
TTF200	LBA nails $\varnothing 4,0 \times 60$	30	26093

* For steel-to-timber connections the reference regulation indicates the possibility of doubling the value of K_{ser} listed in the table (7.1 (3)).

GENERAL PRINCIPLES:

- Characteristic values are consistent with EN 1995-1-1 and in accordance with ETA-11/0496. The design values of the anchors for concrete are calculated in accordance with the respective European Technical Assessments (see Chapter 6 ANCORS FOR CONCRETE). The connection design strength values are obtained from the values on the table as follows:

$$R_d = \min \left\{ \begin{array}{l} \frac{R_{k, \text{timber}} \cdot k_{mod}}{\gamma_M} \\ \frac{R_{k, \text{steel}}}{\gamma_{steel}} \\ R_{d, \text{concrete}} \end{array} \right.$$

The coefficients k_{mod} , γ_M and γ_{steel} should be taken according to the current regulations used for the calculation.

- Dimensioning and verification of timber and concrete elements must be carried out separately. Verify that there are no brittle fractures before reaching the connection strength.
- Structural elements in timber, to which the connection devices are fastened, must be prevented from rotating.
- For the calculation process a timber density $\rho_k = 350 \text{ kg/m}^3$ has been considered. For higher ρ_k values, the strength on timber side can be converted by the k_{dens} value:

$$k_{dens} = \left(\frac{\rho_k}{350} \right)^{0,5} \quad \text{for } 350 \text{ kg/m}^3 \leq \rho_k \leq 420 \text{ kg/m}^3$$

$$k_{dens} = \left(\frac{\rho_k}{350} \right)^{0,5} \quad \text{for LVL with } \rho_k \leq 500 \text{ kg/m}^3$$

- In the calculation phase, a strength class of C25/30 concrete with thin reinforcement was considered, in the absence of spacing and distances from the edge and minimum thickness indicated in the tables listing the installation parameters of the anchors used. The strength values are valid for the calculation hypotheses defined in the table; for boundary conditions different from the ones in the table (e.g. minimum distances from the edge or different concrete thickness), the concrete-side anchors can be verified using MyProject calculation software according to the design requirements.
- Seismic design in performance category C2, without ductility requirements on anchors (option a2) elastic design according to EOTA TR045. For chemical anchors subjected to shear stress it is assumed that the annular space between the anchor and the plate hole is filled ($\alpha_{gap}=1$).
