

UNIVERSAL ANGLE BRACKET FOR SHEAR AND TENSILE LOADS

VERSATILE

Available in four models to meet multiple fastening requirements for CLT or timber frame walls. ETA-certified strengths with resilient XYLOFON PLATE profile.

A CONDENSATION OF INNOVATION

The timber-to-timber configuration can be installed with LBA nails or LBS screws or HBS PLATE screws. The addition of the optional VGS full thread connectors provides the angle bracket with unimaginable strengths.

SURPRISING STRENGTHS

Excellent strength values for forces in all directions, with the possibility of use in timber-to-timber or timber-to-concrete configurations. On concrete, the additional washer provides surprising strengths.

TIMBER FRAME

Optimised partial nailing allow installation even with the presence of bedding grout. It can also be used on smaller frame walls (38 mm | 2").

SERVICE CLASS

SC1 SC2

MATERIAL

S250
Z275

NINO: carbon steel S250GD+Z275

S235
Fe/Zn12c

NINO WASHER: S235 + Fe/Zn12c carbon steel

EXTERNAL LOADS

USA, Canada and more design values available online.

FIELDS OF USE

Shear and tension joints with small-medium stress.
Also optimised for fastening frame walls.
Timber-to-timber, timber-to-concrete and timber-to-steel configurations.

Can be applied to:

- solid timber and glulam
- timber frame
- CLT and LVL panels

A SINGLE AND CONCEALED ANGLE BRACKET

A single type of angle bracket for shear and tensile forces. It can be integrated into the floor or false ceiling panels.

RAISED WALL

Partial nailing patterns allow installation on CLT walls in the presence of a base plate or concrete kerb up to 120 mm high.

NOTES

The height of the H_B intermediate layer (levelling grout, sill or timber platform beam) is determined by taking into account the regulatory requirements for fastenings on timber:

- CLT: minimum distances according to ÖNORM EN 1995:2014 - Annex K for nails and ETA-11/0030 for screws.
- C/GL: minimum distances for solid timber or glulam consistent with EN 1995:2014 according to ETA considering a timber density $\rho_k \leq 420 \text{ kg/m}^3$.

- The minimum platform thickness $H_{SP \min}$ was determined by considering $a_{4,c} \geq 13 \text{ mm}$ and $a_{4,t} \geq 13 \text{ mm}$ with a minimum height of 38 mm in accordance with the requirements in ETA-22/0089.

STRUCTURAL VALUES | TIMBER-TO-TIMBER | F₁

		LBS	Ø5 x 50			41,2	

^(*) In the case of installation coupled with an acoustic profile, the R_{1,k} timber strength must be assumed to be 37.2 kN.

INSTALLATION WITH INCLINED SCREWS | TIMBER-TO-TIMBER

The possibility of installing inclined VGS screws in all models broadens the design possibilities and offers solutions for a wide range of applications, confirming NINO angle brackets as an excellent choice for excellent performance in terms of both shear and tensile loads.

Example: installation of a NINO15080 angle bracket with inclined VGS screws

Example: installation of NINO15080 angle brackets with inclined VGS screws for fastening inter-storey walls with different thickness values

NOTES

⁽¹⁾ The load-bearing capacity values listed are valid for installation with Ø9 VGS screws of length ≥ 140 mm. For screws of shorter length L, R_{1,k} timber must be multiplied by a reduction factor of L/140.

- The strength values listed are also valid for installation with XYLOFON acoustic profile below the horizontal flange.

The concrete-side strength values for installation with a washer are calculated assuming a t_{fix} thickness of 11 mm. For installation without washer, a t_{fix} value of 3 mm was assumed.

GENERAL PRINCIPLES

For the GENERAL PRINCIPLES of calculation, see page 215.

ANCHORS VERIFICATION FOR STRESS LOADING F_1

INSTALLATION WITH AND WITHOUT NINO WASHER

Fastening elements to the concrete through anchors shall be verified according to the load acting on the anchor, which can be evaluated through the tabulated geometric parameters (k_t).

The anchor group must be verified for:

$$N_{Sd,z} = k_{t//} \times F_{1,d}$$

ANCHORS VERIFICATION FOR STRESS LOADING F_{2/3}

INSTALLATION WITHOUT WASHER

Fastening elements to the concrete through anchors shall be verified according to the load acting on the anchor, which can be evaluated through the tabulated geometric parameters (e).

The anchor group must be verified for:

$$V_{Sd,x} = F_{2/3,d}$$

$$M_{Sd,z} = F_{2/3,d} \cdot e_y$$

INSTALLATION WITH WASHER

In the case of installation with washer, the fastening elements to the concrete through anchors must be verified according to the load acting on the anchor, which can be evaluated through the tabulated geometric parameters (e).

The anchor group must be verified for:

$$V_{Sd,x} = F_{2/3,d}$$

$$M_{Sd,z} = F_{2/3,d} \cdot e_y$$

$$M_{Sd,y} = F_{2/3,d} \cdot e_z$$

NOTES

- The F₄, F₅, F_{4/5} values in the table are valid for calculation eccentricity e=0 (timber elements prevented from rotating).
- Refer to ETA-22/0089 for K_{4,ser} stiffness values in timber-to-timber and timber-to-concrete configuration.
- The strength values listed are also valid for installation with XYLOFON acoustic profile below the horizontal flange.

NOTES

- The F₄, F₅, F_{4/5} values in the table are valid for the calculation eccentricity e=0 (timber elements prevented from rotating).
- Refer to ETA-22/0089 for K_{4,ser} stiffness values in timber-to-timber and timber-to-concrete configuration.

GENERAL PRINCIPLES

- Characteristic values comply with the EN1995:2014 standard in accordance with ETA-22/0089.
- Design values can be obtained from values in the table as follows:

$$R_d = \min \left\{ \frac{R_{k \text{ timber}} \cdot k_{mod}}{\gamma_M}, R_{d \text{ concrete}} \right\}$$

The coefficients k_{mod} and γ_M should be taken according to the current regulations used for the calculation.

- The characteristic values of the load-bearing capacity $R_{k \text{ timber}}$ are determined for the combined timber-side and steel-side failure.
- Installation with nails and screws of shorter length than proposed in the table is possible. In this case, the bearing capacity values $R_{k \text{ timber}}$ must be multiplied by the following reductive factor k_F :

- for nails

$$k_F = \min \left\{ \frac{F_{v,short,Rk}}{2,66 \text{ kN}}; \frac{F_{ax,short,Rk}}{1,28 \text{ kN}} \right\}$$

- for screws

$$k_F = \min \left\{ \frac{F_{v,short,Rk}}{2,25 \text{ kN}}; \frac{F_{ax,short,Rk}}{2,63 \text{ kN}} \right\}$$

$F_{v,short,Rk}$ = characteristic shear strength of the nail or screw

$F_{ax,short,Rk}$ = characteristic withdrawal strength of the nail or screw

- Dimensioning and verification of timber and concrete elements must be carried out separately. Verify that there are no brittle failures before reaching the connection strength.
- Structural elements in timber, to which the connection devices are fastened, must be prevented from rotating.
- A timber density of $\rho_k = 350 \text{ kg/m}^3$ was considered for the calculation process. For higher ρ_k values, the strength on timber side can be converted by the k_{dens} value:

$$k_{dens} = \left(\frac{\rho_k}{350} \right)^{0,5} \quad \text{for } 350 \text{ kg/m}^3 \leq \rho_k \leq 420 \text{ kg/m}^3$$

$$k_{dens} = \left(\frac{\rho_k}{350} \right)^{0,5} \quad \text{for LVL with } \rho_k \leq 500 \text{ kg/m}^3$$

- In the calculation phase, a strength class of C25/30 concrete with thin reinforcement was considered, in the absence of spacing and distances from the edge and minimum thickness indicated in the tables listing the installation parameters of the anchors used.
- The strength values are valid for the calculation hypothesis defined in the table; for boundary conditions different from the ones in the table (e.g. minimum distances from the edge or different concrete thickness), the concrete-side anchors can be verified using MyProject calculation software according to the design requirements.
- The anchors seismic design was carried out in performance category C2, without ductility requirements on anchors (option a2) and elastic design according to EN 1992:2018, with $\alpha_{sus} = 0,6$. For chemical anchors it is assumed that the annular space between the anchor and the plate hole is filled ($\alpha_{gap} = 1$).
- The product ETAs for the anchors used in the concrete-side strength calculation are indicated below:
 - VIN-FIX chemical anchor according to ETA-20/0363;
 - HYB-FIX chemical anchor according to ETA-20/1285;
 - EPO-FIX chemical anchor according to ETA-23/0419;
 - SKR screw-in anchor according to ETA-24/0024;
 - AB1 mechanical anchor according to ETA-17/0481 (M12).
