

SCI A2 | AISI304

COUNTERSUNK SCREW

3 THORNS TIP

Thanks to the 3 THORNS tip, minimum installation distances are reduced. More screws can be used in less space and larger screws in smaller elements. Costs and time for project implementation are reduced.

SUPERIOR STRENGTH

New tip, special asymmetrical umbrella thread, elongated reamer cutter and under-head cutting ribs provide the screw with higher torsional strength and safer screwing.

A2 | AISI304

A2 austenitic stainless steel. It offers high corrosion resistance. Suitable for outdoor applications up to 1 km from the sea in class C4 on most acid woods in class T4.

FIELDS OF USE

Use in aggressive outdoor environments. Wooden boards with density of $< 470 \text{ kg/m}^3$ (without pre-drill) and $< 620 \text{ kg/m}^3$ (with pre-drill).

SCI A2 COIL

Bound version available for fast and accurate installation.
Ideal for large projects.

Compatible with KMR 3373 and KMR 3352 for Ø4 and KMR 3372 and KMR 3338 for Ø5. For further information see page 403.

α = load-to-grain angle
 $d = d_1$ = nominal screw diameter

MINIMUM DISTANCES

NOTES

- The minimum distances are according to EN 1995:2014 considering a calculation diameter of d = nominal screw diameter.
- The minimum spacing for all steel-to-timber connections (a_1 , a_2) can be multiplied by a coefficient of 0,7.
- The minimum spacing for all panel-to-timber connections (a_1 , a_2) can be multiplied by a coefficient of 0,85.

STRUCTURAL VALUES

NOTES

- The characteristic timber-to-timber shear strengths were evaluated by considering an angle ϵ of 90° between the grains of the second element and the connector.
- The characteristic thread withdrawal strengths were evaluated by considering an angle ϵ of 90° between the grains of the timber element and the connector.
- For the calculation process a timber characteristic density $\rho_k = 385 \text{ kg/m}^3$ has been considered.
 For different ρ_k values, the strength values in the table can be converted by the k_{dens} coefficient (see page 42).
- For a row of n screws arranged parallel to the direction of the grain at a distance a_1 , the characteristic effective shear bearing capacity $R_{ef,V,k}$ can be calculated by means of the effective number n_{ef} (see page 42).

GENERAL PRINCIPLES

- Characteristic values are consistent with EN 1995:2014 and in accordance with EN 14592.
- Design values can be obtained from characteristic values as follows:

$$R_d = \frac{R_k \cdot k_{mod}}{\gamma_M}$$

The coefficients γ_M and k_{mod} should be taken according to the current regulations used for the calculation.

- Mechanical strength values and screw geometry comply with CE marking according to EN 14592.
- Dimensioning and verification of the timber elements must be carried out separately.

- The characteristic shear resistances are calculated for screws inserted without pre-drilling hole. In the case of screws inserted with pre-drilling hole, greater resistance values can be obtained.
- The screws must be positioned in accordance with the minimum distances.
- The thread withdrawal characteristic strength has been evaluated considering a fixing length equal to b.
- The characteristic resistance to head pull-through was calculated using timber elements.
- The characteristic timber-to-timber shear strengths with washer were evaluated considering the actual thread length in the second element.
