

ALU START

ALUMINIUM SYSTEM FOR THE CONNECTION OF BUILDINGS TO THE GROUND

CE MARK ACCORDING TO ETA

The profile is capable of transferring shear, tensile and compressive forces into the foundation. The strengths are tested, calculated and certified according to specific ETA.

RISE FROM THE FOUNDATION

The profile allows to eliminate contact between the timber panels (CLT or TIMBER FRAME) and the concrete substructure. Excellent durability of the building connection to the ground.

SUPPORT SURFACE LEVELLING

Thanks to the special assembly templates, the supporting surface level is easy to adjust. The "levelling" of the entire building is simple, precise and fast.

CHARACTERISTICS

FOCUS	raising and levelling of CLT and TIMBER FRAME panels
WIDTH	up to 270 mm <i>up to 10 5/8 in</i>
STRENGTH	in all stress directions
FASTENERS	LBA, LBS, SKR-E, AB1, VIN-FIX, HYB-FIX

VIDEO

Scan the QR Code and watch the video on our YouTube channel

MATERIAL

Aluminium alloy three dimensional perforated plate.

FIELDS OF USE

Connection to the ground of timber buildings with riser from the foundation and levelling of the supporting surface

- CLT walls
- TIMBER FRAME walls

DURABILITY

Thanks to the rise from the foundation and the aluminium material, the building base is protected against capillary rising. The ground connection provides durability and health to the structure.

CERTIFIED STRENGTH

Thanks to the side flange, the profile can be fastened to the timber wall by means of nails or screws which guarantee excellent strength in all directions certified by CE marking according to ETA.

■ INSTALLATION | TIMBER

ALU START is an extruded aluminium profile designed to house the walls and to solve the foundation-wall node in timber.

The profile is certified to withstand all the stresses typical for a timber wall, i.e. F₁, F_{2/3}, F₄ and F₅.

ALU START profiles are designed to fit both CLT and TIMBERFRAME walls.

The use of the lateral extension ALU START35 allows its use with CLT and TIMBER FRAME walls having greater thickness.

a. bracing sheet

b. strut

c. abeam

The ALU START35 side extension is easily inserted into the ALU START profiles. The compound profile is then stopped in position by two ALUSPIN pins to be inserted at the ends. It is possible to install up to two ALU START35 profiles on a profile with a nailed flange.

PROFILE SELECTION

profile	reference width	recommended thickness t	
		minimum	maximum
ALU START80	80 mm 3.15 in	-	95 mm 3.74 in

■ INSTALLATION | TIMBER

NAILING

ALU START profiles can be used for different building systems (CLT / TIMBER FRAME).
 Depending on the construction technology, different nailings can be used in accordance with the minimum distances.

MINIMUM DISTANCES

TIMBER minimum distances		nails LBA Ø4	screws LBS Ø5
C/GL	a _{4,t} [mm]	≥28 mm 1.10 in	-
	H _B [mm]	≥73 mm 2.87 in	-
	a _{3,t} [mm]	≥60 mm 2.36 in	-
CLT	a _{4,t} [mm]	≥28 mm 1.10 in	≥30 mm 1.18 in

- C/GL: minimum distances for solid timber or glulam consistent with EN 1995-1-1 according to ETA considering a timber density $\rho_k \leq 420 \text{ kg/m}^3$.
- CLT minimum distances for Cross Laminated Timber according to ÖNORM EN 1995-1-1 (Annex K) for nails and ETA 11/0030 for screws.

MINIMUM DISTANCES FOR NAILING ON SOLID TIMBER (C) OR GLULAM (GL)

MINIMUM DISTANCES FOR NAILING ON CLT

■ INSTALLATION | CONCRETE

The ALU START profiles must be fastened on concrete with a number of anchors suitable for the design loads. It is possible to arrange the anchors in all the holes, or choose larger installation spacing.

Details of the assembly phase in the "POSITIONING" section.

■ ADDITIONAL CONNECTION SYSTEMS

The ALU START geometry allows using additional connection systems such as TITAN TCN and WHT, even with a levelling layer between the profile and the foundation.

Certified partial nailings are available for TITAN TCN installation which allow laying bedding mortar with a thickness up to 30 mm.

For the structural values and nailing of the TITAN TCN angle brackets and the WHT hold downs, see the respective technical data sheets on the website.

EXAMPLE OF INSTALLATION WITH TITAN TCN240

POSITIONING

Assembly includes the use of special JIG START templates for the height levelling of the profiles, for the linear joint and for creating 90° angles.

JIGSTARTI templates can connect two consecutive profiles and must be positioned on both sides of ALU START, without positioning constraints along the development.

JIGSTARTL templates can be used for 90° angle connection.

On each template there is a hexagonal head bolt, which allows the height adjustment of the aluminium profiles.

Preliminary positioning of the profiles on the laying surface using the templates and cutting the elements to size, if necessary.

Definitive planimetric drawing with verification of lengths and diagonals.

Fine adjustment with JIG START templates of the total length of the wall, compensating the tolerances of the profiles cut to size.

Longitudinal levelling of ALU START rods.

Lateral levelling of the rods.

Construction of formwork with timber battens.

Creation of the bedding layer between the profile and the concrete support.

Creation of the bedding layer between the profile and the concrete support.

Insert the concrete anchors following the anchor installation instructions.

Removal of JIG START templates, which can be reused.

Positioning of the walls using Ø6 or Ø8 screws to bring the panel closer to the aluminium profile.

Profiles fastening with nails or screws.

ALU START | PARTIAL FASTENING PATTERNS

It is possible to apply partial nailing patterns according to the design and installation requirements of the walls.

* This pattern is not suitable for use on solid timber/glulam in the presence of shear loads $F_{2/3}$.

nailing pattern	type	holes fastening Ø5	
		Ø x L [mm]	n _v [pcs/m]
Total fastening	LBA nails screws LBS	Ø4,0 x 60 Ø5,0 x 50	71
Pattern 1			35
Pattern 2			23
Pattern 3			17

STRUCTURAL VALUES | COMPRESSION JOINTS $F_{1,c}$

It is possible to cut the profiles according to the design requirements; profiles with length less than 600 mm | 1.97 ft are to be considered for compressive strength only.

COMPRESSION STRENGTH $F_{1,c}$ ON ALUMINIUM SIDE

configuration	reference width [mm]	ALUMINIUM		
		γ_{alu}	$R_{1,c,k}$ [kN/m]	$\rho_{1,c,Rk}$ [MPa]
ALUSTART35	-	γ_{M1}	88,8	2,54
ALUSTART80	80		504,2	6,3
ALUSTART100	100		630,2	6,3
ALUSTART120	120		961,1	8,01
ALUSTART100 + ALUSTART35	135		719,0	$6,30^{(1)} + 2,54^{(2)}$
ALUSTART120 + ALUSTART35	155		1049,9	$8,01^{(1)} + 2,54^{(2)}$
ALUSTART175	175		1540,6	8,8
ALUSTART120 + 2 x ALUSTART35	190		1138,7	$8,01^{(1)} + 2,54^{(2)}$
ALUSTART175 + ALUSTART35	210		1629,4	$8,8^{(1)} + 2,54^{(2)}$
ALUSTART175 + 2 x ALUSTART35	245		1718,2	$8,8^{(1)} + 2,54^{(2)}$

⁽¹⁾ Value referred to the main profile.

⁽²⁾ Value referred to ALUSTART35 extension.

For walls of different widths to the reference width, the compression strength of the aluminium profile can be calculated by multiplying the parameter $\rho_{1,c,Rk}$ by the actual width of the wall.

For example, for a 140 wall, ALUSTART100 + ALUSTART35 profile is selected.

$R_{1,c,k} = 6,30 \cdot 100 + 2,54 \cdot 35 = 719$ kN

The compression strength of the timber wall should be calculated by the designer according to EN1995-1-1.

STRUCTURAL VALUES | TENSILE JOINT $F_{1,t}$

TENSILE STRENGTH $F_{1,t}$ ON TIMBER-TO-ALUMINIUM SIDE

		CLT	C/GL	ALUMINIUM		CONCRETE	RIGIDITY

DIMENSIONING OF ALTERNATIVE ANCHORS | $F_{1,t}$

Fastening elements to the concrete through anchors shall be verified according to the load acting on the anchor, which can be evaluated through the geometric parameters on the table (k_t).

The anchor group must be verified for:

$$N_{Ed,z,bolts} = F_{1,t} \times k_{1,t,overall}$$

STRUCTURAL VALUES | SHEAR JOINT $F_{2/3}$

SHEAR STRENGTH $F_{2/3}$ ON TIMBER-TO-ALUMINIUM SIDE

• seismic	HYB-FIX 8.8	M12 x 190	45,0	22,5

DIMENSIONING OF ALTERNATIVE ANCHORS | $F_{2/3}$

Fastening to concrete using alternative anchors must be verified on the basis of the stressing forces of the anchors, which depend on the fastening configuration. In order to consider an anchor as a reagent it is necessary that the distance of the anchor from the profile edge is at least 50 mm.

The anchor group must be verified for:

$$V_{Ed,x,bolts} = F_{2/3}$$

$$M_{Ed,z,bolts} = F_{2/3,d} \times e_y$$

$$M_{Ed,x,bolts} = F_{2/3,d} \times e_z$$

with $F_{2/3,d}$ = shear stress acting on the ALU START connector

The check is satisfied if the design shear strength of the anchor group is greater than the design stress: $R_{2/3,d \text{ concrete}} \geq F_{2/3,d}$.

STRUCTURAL VALUES | SHEAR JOINT F₄

SHEAR STRENGTH F₄ ON TIMBER-TO-ALUMINIUM SIDE

	ALUMINIUM		CONCRETE	RIGIDITY
F ₄	R _{4,k alu} [kN/m]	Y _{alu}	k _{4t, overall}	K _{4, ser} [N/mm * 1/m]
ALUSTART*	100	Y _{M1}	1,84	27000

* valid for all profiles.

The installation of the ALUSTART35 extension, or the presence of a mortar layer up to 30 mm | 1.18 in with minimum class M10, do not affect the values in the table.

SHEAR STRENGTH F₄ ON CONCRETE SIDE

* Valid for all profiles.

ALU START | COMBINED STRESSES

With regard to timber and aluminium, it is possible to combine the effect of the different actions through the following expressions:

$$\left(\frac{F_{1,t,Ed}}{R_{1,t,d}} \right)^2 + \left(\frac{F_{2/3,Ed}}{R_{2/3,d}} \right)^2 + \left(\frac{F_{4,Ed}}{R_{4,d}} \right)^2 \leq 1$$

$$\left(\frac{F_{1,t,Ed}}{R_{1,t,d}} \right)^2 + \left(\frac{F_{2/3,Ed}}{R_{2/3,d}} \right)^2 + \left(\frac{F_{5,Ed}}{R_{5,d}} \right)^2 \leq 1$$

Regarding checks on the anchor side, the results of the loads must be applied to the group of anchors, following the indications of the diagrams relating to each load direction.

GENERAL PRINCIPLES:

- Characteristic values according to EN 1995-1-1.
The design values of the anchors for concrete are calculated in accordance with the respective European Technical Assessments.
The connection design strength values are obtained from the values on the table as follows:

$$R_{1,c,d} = \frac{R_{1,c,k}}{\gamma_{alu}} \cdot l$$

$$R_{1,t,d} = \min \left\{ \begin{array}{l} \frac{R_{1,t,k \text{ timber}} \cdot k_{mod}}{\gamma_M} \cdot l \\ \frac{R_{1,t,k \text{ alu}}}{\gamma_{alu}} \cdot l \\ R_{1,t,d \text{ concrete}} \cdot l^* \end{array} \right.$$

$$R_{2/3,d} = \min \left\{ \begin{array}{l} \frac{R_{2/3,k \text{ timber}} \cdot k_{mod}}{\gamma_M} \cdot l \\ \frac{R_{2/3,k \text{ alu}}}{\gamma_{alu}} \cdot l \\ R_{2/3,d \text{ concrete}} \cdot l^* \end{array} \right.$$

$$R_{4,d} = \min \left\{ \begin{array}{l} \frac{R_{4,k \text{ alu}}}{\gamma_{alu}} \cdot l \\ R_{4,d \text{ concrete}} \cdot l^* \end{array} \right.$$

$$R_{5,d} = \min \left\{ \begin{array}{l} \frac{R_{5,k \text{ timber}} \cdot k_{mod}}{\gamma_M} \cdot l \\ R_{5,d \text{ concrete}} \cdot l^* \end{array} \right.$$

The dimension l is the length of the profile used, to be used in metres in the formulas. The minimum length is 600 mm, except in the case where the profile is subject to compression.

The dimension l^* is the length of the profile used approximated to the lower multiple of 200 mm, to be used in metres in the formulas. The minimum length is 600 mm.

E.g. $l = 680 \text{ mm} \rightarrow l^* = 600 \text{ mm}$

- The calculation process used a timber characteristic density of $\rho_k = 350 \text{ kg/m}^3$ for timber and $\rho_k = 385 \text{ kg/m}^3$ for CLT of timber C24. A C25/30 class concrete with a thin reinforcement and minimum thickness indicated in the table has been considered.
- Dimensioning and verification of timber and concrete elements must be carried out separately.
- The strength values on the concrete side are valid for the calculation hypotheses defined in the respective tables; for boundary conditions different from the ones in the table (e.g. minimum distances from the edge, lower number of anchors/m), the anchors-to-concrete can be verified using MyProject calculation software according to the design requirements.
- The anchors seismic design was carried out in performance category C2, without ductility requirements on anchors (option a2) elastic design according to EOTA TR45/EN 1992-4, with $\alpha_{SUS} = 0.6$. For chemical anchors it is assumed that the annular space between the anchor and the plate hole is filled ($\alpha_{gap} = 1$).
